Should we stop flying on holiday?

You are going to read a text about meetings. Some words are missing. Use the words in brackets to form a new word for each gap!

One of the problems with comparing the __________(CONTRIBUTE) of different forms of transport is that they all take different routes. We looked at a hypothetical journey from London to Naples in Italy and calculated the carbon _________(EMIT) released into the atmosphere by making the journey by air, land and sea.

We also considered some more ______ (USUAL) options. Would travelling by horse actually be carbon neutral, for example? A horse emits about 18 kg of methane a year. This is equivalent to 378 carbon units because methane is 21 times more (POWER) a greenhouse gas than carbon dioxide.

Going on holiday by horse may appeal to cowboys, but our trip to Italy would take two months each way. ______ (SURPRISE), the car is the next best

 (CHOOSE), assuming there are three people

 (SHARE) it. But for a single trip the train would be the

 (GREEN) option.

Should we stop flying on holiday?

You are going to read a text about meetings. Some words are missing. Use the words in brackets to form a new word for each gap!

One of the problems with comparing the *contributions* (<u>CONTRIBUTE</u>) of different forms of transport is that they all take different routes. We looked at a hypothetical journey from London to Naples in Italy and calculated the carbon *emissions* (<u>EMIT</u>) released into the atmosphere by making the journey by air, land and sea.

We also considered some more *unusual* (<u>USUAL</u>) options. Would travelling by horse actually be carbon neutral, for example? A horse emits about 18 kg of methane a year. This is equivalent to 378 carbon units because methane is 21 times more *powerful* (<u>POWER</u>) a greenhouse gas than carbon dioxide.

We can calculate the total contribution by *working* (<u>WORK</u>) out the number of days it would take to make this journey and *multiplying* (<u>MULTIPLY</u>) this by the methane emitted each day.

Going on holiday by horse may appeal to cowboys, but our trip to Italy would take two months each way. *Surprisingly* (<u>SURPRISE</u>), the car is the next best *choice* (<u>CHOOSE</u>), assuming there are three people *sharing* (<u>SHARE</u>) it. But for a single trip the train would be the *greenest* (<u>GREEN</u>) option.
